

DO NOT TAKE FOR GRANTED YOUR COMFORTABLE WATER-CONSUMING LIFE

Annual Water Consumption:

**2m²
of grass
on a golf court**

**= A Child
in arid area**

DUAN Jingling

BA in Environmental Management,
College of Environmental Science and Engineering,
Peking University, PRC

I was born and brought up in Beijing, a metropolitan where people have enjoyed the sufficiency of water supply. Rich access to water in big cities blinds people from seeing the reality of severe water shortage. Not seeing the reality could not afford to ignore the existence of the reality. Water is the living source of all beings, and if we want to leave our children a legacy, now is the time to take action.

* Data Resource:
A research conducted by Golf Course Superintendents Association of America in 2007 suggests that a normal golf court averagely has 323748 m² grass to be watered, consuming 18,810,000 tons of water every year. According to my field research in an arid region of Inner Mongolia in 2011, water usage is limited to 30 liters per capita per day.
